Service Page Blueprint — SACCO & MFB Due Diligence

lightanalytics.github.io/services/sacco-mfb-due-diligence/

Full copy and build reference for the SACCO & MFB Due Diligence page. This is the only service covered in this document. Core positioning: independent, evidence-based read on institutions where essentially no external coverage currently exists — adapted from, not copy-pasted from, the Counterparty Intelligence Reports framework, since SACCOs and MFBs are structured and regulated differently from commercial banks.

PAGE TITLE

SACCO & MFB Due Diligence

OPENING / HOOK

A bank depositor has decades of analyst coverage, ratings agencies, and financial press watching the institution holding their money. A SACCO or MFB member, investor, or lender has almost none of that — no equivalent independent coverage exists at the individual-institution level. This report builds it.

WHO THIS IS FOR

For anyone about to extend credit, commit capital, or place trust in a specific SACCO or microfinance bank without an independent, evidence-based read on its current condition — whether that's an institutional lender or investor, or a member or oversight committee seeking a clearer picture of their own institution.

Deliberately not scoped to named buyer categories, consistent with the rest of the site.

PROBLEMS THIS ADDRESSES

- Members and smaller investors have no equivalent of bank equity research or ratings coverage for individual SACCOs — a real, currently unaddressed information gap, with real Kenyan precedent for what happens when it goes wrong
- SASRA supervision is generally perceived as less rigorous and less timely than CBK oversight of banks — independent verification carries more weight where regulatory oversight can't be fully relied on
- Total whitespace on institutional coverage — no major data or ratings provider covers SACCOs or MFBs individually
- Governance risk specific to the cooperative structure — member-elected boards, often without deep financial oversight capacity, create a known pattern of related-party or insider lending to board members and officials

- Scope creep beyond the original mandate — many SACCOs have expanded into FOSA (front office service activity) products functioning like retail banking, layering on risk the membership may not fully understand

WHAT YOU GET

An evidence-based read of the institution's current condition, adapted to how SACCOs and MFBs are actually structured and regulated:

- Financial condition — asset quality, funding structure, capital position, drawn from SASRA filings and published statements
- Governance structure — board composition and election process, oversight capacity, and related-party lending exposure specific to the cooperative model
- Regulatory and compliance record — drawn from SASRA filings, Gazette notices, and court records where they exist
- Scope of activity — including FOSA and other product lines beyond the core savings/credit mandate

Every finding traceable to a named, dated public source. Same discipline as every other report on this site.

HONEST SCOPE NOTE

Depth of evidence varies by institution and by what's actually disclosed under the SASRA regime — generally thinner and less standardized than commercial bank disclosure under CBK. Where the public record is limited for a given institution, that's stated plainly, not padded to look more complete than it is.

WHAT IT IS / ISN'T

Not a credit rating. Not a recommendation to join, lend to, or invest in the institution. Not a guarantee of financial soundness — an independent, sourced account of what the public record currently shows.

HOW IT WORKS

Scoped after an initial conversation about the specific institution and decision at hand, then delivered as a structured written report. Turnaround agreed upfront based on scope.

CALL TO ACTION

Have a specific SACCO or microfinance bank in mind? Get in touch — happy to talk through what's realistically available before anything is scoped.

Internal Pricing Reference

NOT FOR THE PUBLIC PAGE. SACCO/MFB pricing needs its own logic, not a straight scale-down of the commercial bank report price. Two pulls in opposite directions: smaller institutions and smaller typical deal sizes argue for pricing below the bank tier; thinner, less digitized, less standardized disclosure can mean more reconciliation effort per engagement, not less. Net: priced below the bank tier but not dramatically so. Treat as a hypothesis to test with a real prospect, same caution as the Datasets pricing.

Buyer type	Scope	Indicative range
Individual member / oversight committee	Lighter-touch read, priced accessibly given far less capital at stake	\$200–\$800
Institutional (DFI, investor, lender)	Full report ahead of extending credit or capital — the cost of doing business	\$2,500–\$10,000, depending on institution size

WHY BELOW THE BANK-REPORT RANGE

Bank-tier Counterparty Intelligence Reports anchor at \$6,000–\$25,000, reflecting larger institutions and larger capital decisions typically at stake. SACCO/MFB institutions and the decisions riding on them are generally smaller, which argues for a lower price ceiling even though the underlying reconciliation work can be comparably hard, or harder, given thinner disclosure standards.

Locked Decisions — This Page

Decision	Resolution
Buyer framing	“Anyone that needs it” — kept wide and situational, not scoped to named buyer categories, consistent with the six-dimension bank framework
Dimensions adapted, not copied	The six-dimension bank framework doesn't map directly — SACCOs are member-owned with elected boards, not banks
Honest scope note	Explicit statement that evidence depth varies by institution and disclosure regime, generally thinner than commercial bank reports
Problems named on page	Member information gap, perceived SASRA supervision gap vs. CBK, total whitespace on institutional coverage
Two-tier buyer pricing	Individual member/oversight-committee tier (\$200–\$800) separate from institutional tier (\$2,500–\$10,000) — not a straight scale-down
Pricing anchor logic	Priced below the commercial bank report range (\$6K–\$25K) given smaller typical institution size and decision sizes
Pricing visibility	Not shown on the public page — internal reference table only, pending real-world validation with a prospect
